

Natural Stone Benchtop Care & Maintenance

Natural stone is a porous material compared to its engineered stone counterpart, and should be treated with the utmost care and have an appropriate seal on it.

Benchtop Concepts applies a sealer to all natural stone tops before installation, which needs to be redone regularly, every six months to a year, to ensure the stone remains functional and in its beautiful state.

Try to avoid acidic foods and liquids as well as highly coloured substances directly in contact with your benchtop. If these happen to get spilt on to the top, they must be cleaned up immediately. When doing this, it's best to use a slightly damp cloth and NOT a scouring pad, as they are abrasive and damaging.

Contact Benchtop Concepts if this occurs.
